PATENT   Attorney Docket No.: 100111255-1
                                              App. Ser. No.: 10/050,917

IN THE CLAIMS:

Please find below a listing of all of the pending claims. The statuses of the claims are set forth in parentheses.

1. (Original) A method of testing a video display device at a remote site using internally generated test patterns , said method comprises:

receiving a request for service on a video display device from an end user at a remote site;

providing an access code to the end user at the remote site to initiate a video display test on the video display device using information stored inside the video display device;

receiving reports from the end user at the remote site; and

diagnosing on a functionality of the video display device based on the reports received from the end user.

2. (Original) The method of claim 1, wherein the video display device is connected to a system, further comprising:

initiating a diagnostic procedure for detecting malfunction occurred outside the video display device.

3. (Original) A method for testing a video display device using internally generated test patterns, the method comprising:

contacting a service center to obtain a test code,

entering the test code from a keypad on a video display device to initiate a visual

PATENT   Attorney Docket No.: 100111255-1
                                              App. Ser. No.: 10/050,917

test that displays a plurality of video display test patterns on a video display screen using

information stored inside the video display device;

> examining each video display test pattern to generate an evaluation;

> reporting the evaluation to the service center; and

> receiving a diagnosis from the service center.

4. (Original) The method of claim 3, further comprising:

> adjusting the video display device based on the diagnosis.

5. (Original) The method of claim 3, wherein the video display device is connected to a

system, further comprising

> executing a diagnostic procedure to locate a malfunctioned component in the system.

6. (Original) A self-testing video display device, comprising:

> a keypad;

> a video display screen;

> a memory that stores information for a video display test program;

> a processor that extracts the information for video display test program from the

memory, converts the information into video display test signals, and executes the video

display test program, wherein the information for the video display test program comprises at

least one test pattern and a description on how to properly examine the at least one test

pattern, and the description is displayed on the video display screen to instruct a user on how

PATENT   Attorney Docket No.: 100111255-1
                                              App. Ser. No.: 10/050,917

to properly examine the at least one test pattern when the at least one pattern is displayed on
the video display test screen;

a controller that sends the video display test signals in a proper format to the video
display screen.

7. (Original) The self-testing video display device according to claim 6, further comprising an
application specific integrated circuit (ASIC), wherein the memory, processor and controller
are located on the ASIC.

8. (Original) The self-testing video display device according to claim 7, further comprising a
video processing unit, wherein the ASIC and the connector are located in the video
processing unit.

9. (Original) The self-testing video display device according to claim 6, wherein the the
keypad is located on a surface of the video display device.

10. (Original) The self-testing video display device according to claim 6, further comprising a
connector that delivers an input signal to the processor.

11. (Original) The self-testing video display device according to claim 6, wherein the
memory is chosen from a list consisting of ROM, DRAM, SRAM, and VRAM.

12. (Canceled).

PATENT

13. (Currently Amended) The self-testing video display device according to claim ~~12~~ 6, wherein the information for the video display test program further comprises information for a diagnostic procedure.

14. (Original) The self-testing video display device according to claim 6, wherein the video display screen is a liquid crystal display screen, an organic light emitting display screen, a fluorescent display screen, or a plasma display screen.

15. (Previously Presented) A video display device, comprising:

    data entry means;

    means for storing information for a video display test program;

    means for determining if an access code entered using the data entry means is valid; and

    means for executing the video display test program in response to determining that the access code is valid.

16. (Previously Presented) The video display device according to claim 15, further comprising means for receiving the code as an input signal.

17. (Previously Presented) The video display device according to claim 15, further comprising means for retrieving the code from a remote location.

PATENT   Attorney Docket No.: 100111255-1
                                                        App. Ser. No.: 10/050,917

18. (Previously Presented) The video display device according to claim 15, further

comprising means for retrieving a diagnostic procedure from a remote location.

19. (Previously Presented) The video display device according to claim 18, further

comprising means for reporting results of the diagnostic procedure to the remote location.

20. (Previously Presented) The video display device according to claim 15, further

comprising means for storing a plurality of valid access codes.

21. (New) The self-testing video display device according to claim 6, wherein the processor

extracts the information for the video display test program in response to a code entered by a

user using the keypad.

22. (New) The self-testing video display device according to claim 6, wherein the processor

in the video display device extracts the information for the video display test program from

the memory in the video display device and executes the video display test program such that

the video display device need not be connected to a computer system to execute the test

program.
